[Overview](#)[Types of relationships](#)[To-One](#)[To-Many](#)[Sideposting and Sideload](#)[Resources and their Relationships to Connected Resources](#)

Overview

Certain objects in your NationBuilder database have associations, or relationships, with each other. For example, **Signups** can belong to a **Recruiter**, and **Memberships** can belong to a **Signup**. These associations should not be confused with [relationship objects](#) in NationBuilder. When two objects are accessible through an API endpoint and have an association, they are referred to as **connected resources**. The diagram below outlines the relationships between these connected resources, such as between a **Signup** and a **Recruiter**.

Types of relationships

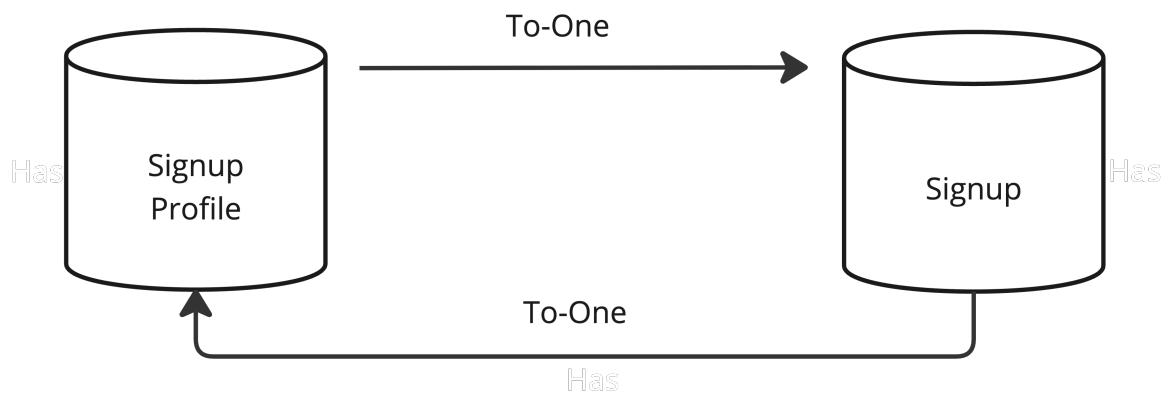

Relationships may be to-one or to-many.

To-One

A to-one relationship in NationBuilder's API refers to a connection between two objects where one object is associated with one instance of another object.

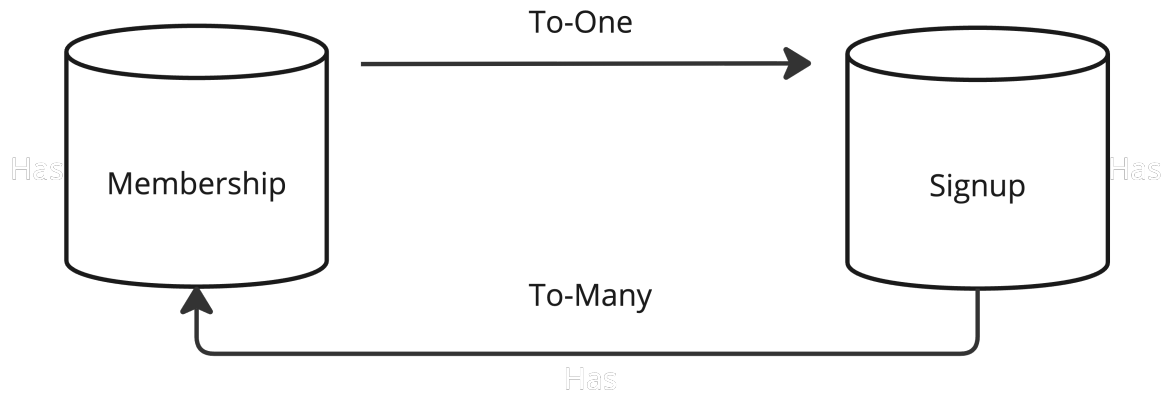

One-to-One: When each instance of an object is tied to exactly one instance of another object, and vice versa. Both objects are uniquely related to one another.

Example: **Signups** and **Signups Profiles**. A **Signup** may only have one **Signup Profile** and a **Signup Profile** may only ever belong to one **Signup**.

Many-to-One: When multiple instances of one object are associated with one instance of another object. In this relationship, one object may have many related instances, but each instance is linked to a single parent.

Example: **Signups** and **Memberships**. A **Membership** belongs to one **Signup**, but a **Signup** may have many **Memberships**.

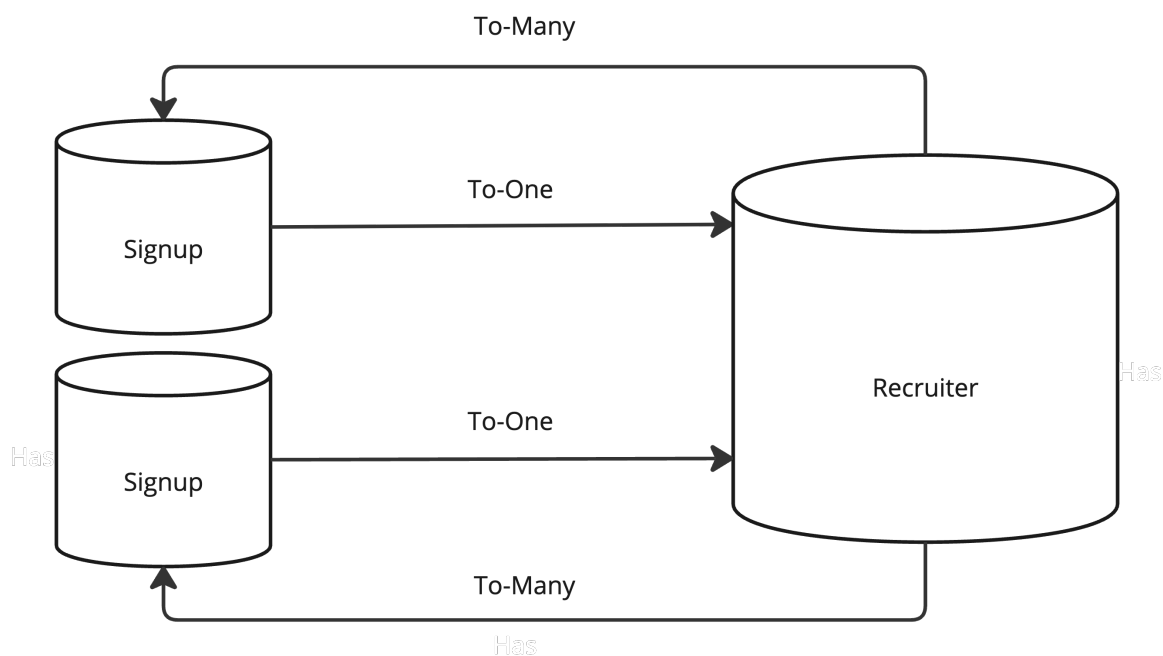

To-Many

This relationship indicates a one-to-many relationship, where one instance of an object can be associated with many instances of another object.

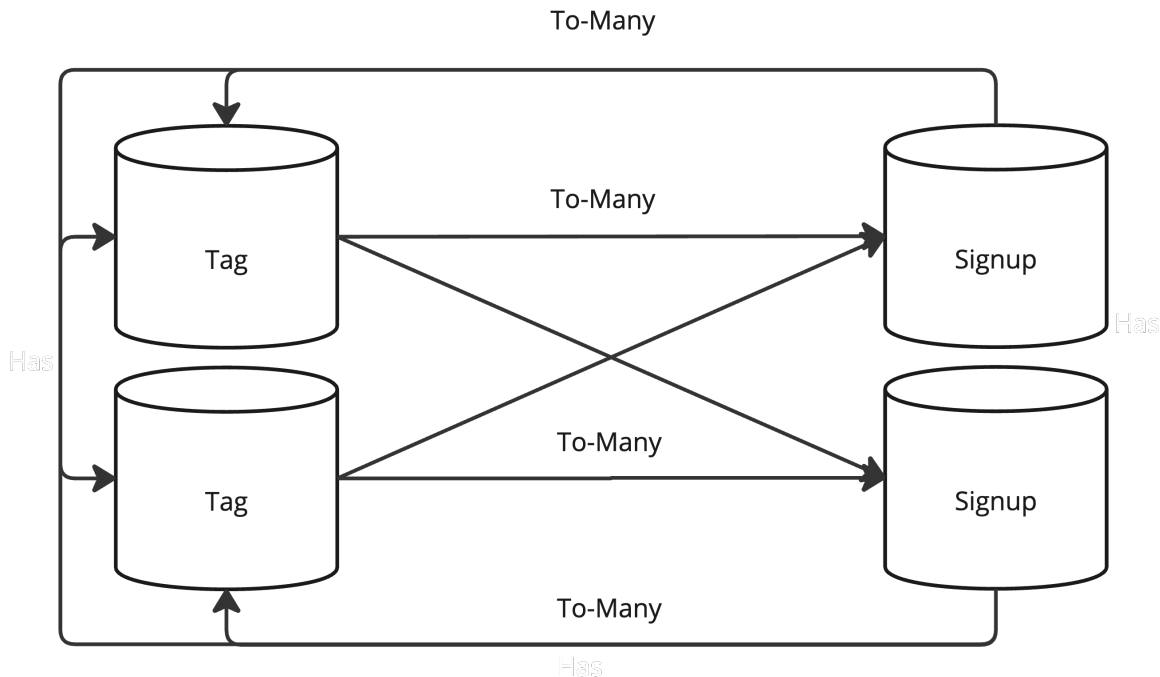

To-Many: When one instance of an object can be associated with many instances of another object.

Example: **Recruiters** and **Signups**. A Recruiter may have many **Signups**, but a **Signup** can only belong to one **Recruiter**.

Many-to-Many: When multiple instances of one object can be associated with multiple instances of another object.

Example: **Signups** and **Signup Tags**. A **Signup** may have many **Tags**, and a **Tag** can belong to many **Signups**.

Sideposting and Sideloading

When accessing certain resources via the API, it is possible to simultaneously view, create, or update that resource along with its connected resource via sideloading and sideposting. Resources that have relationships with each other can be created, updated, or retrieved in the same request as their connected resources. When sideposting or sideloading, any resource can be accessed as long as it has a relationship to the primary resource, it does not matter what the relationship is. For example, a membership can be updated via a post to the signup resource, and a signup can be updated via a post to the membership resource.

Examples of sideposting and sideloading can be found in our [core concepts article here](#).

Resources and their Relationships to Connected Resources

Below are all the resources and their relationships with other resources. When a resource has a relationship with an object that does not have its own dedicated resource, the related resource is specified. For example, the **Recruiter** object does not have its own resource, but **Recruiter** objects can be accessed through the **Signup** resource. For instance, a donation's recruiter is accessed through the **Signup** resource, so it is documented as `Recruiter (SignupResource)` under the **Donation** resource.

Resource	Connected Resource	Relationship
Automation Enrollment	Automation	To-One
Automation Enrollment	Signup	To-One
Automation	Enrollments (AutomationEnrollmentResource)	To-Many
Ballot	Election	To-One
Ballot	Voter	To-One
Broadcaster	Point Person (SignupResource)	To-One
Broadcaster	Voicemail Point Person (SignupResource)	To-One
